AWS VPC PEERING PROJECT

Project Report & Evidence

Submitted by	Anchal Gupta
College	Graphic Era Hill University Dehradun
AWS Region	Asia Pacific (Sydney) — ap-southeast-2
Project	Private connectivity between two Amazon VPCs using VPC Peering
Submission date	30 October 2026

Project objective

Create two separate Amazon VPCs and establish private network communication between workloads in them through an active VPC peering connection. This report documents the AWS resources, routing, security rules, SSH access and connectivity tests shown in the supplied evidence.

1. Project architecture

The project was configured in the Sydney AWS Region. VPC A contains a public bastion host and a private application instance. VPC B contains a private application instance. The VPC peering connection links the two VPC networks.

Component	Configuration
VPC A	ewb-vpc-a — 10.10.0.0/16
Public subnet A	ewb-a-public-1 — 10.10.1.0/24
Bastion	10.10.1.10
Private subnet A	ewb-a-private-1 — 10.10.2.0/24
App-A	10.10.2.10
VPC B	ewb-vpc-b — 10.20.0.0/16
Private subnet B	ewb-b-private-1 — 10.20.1.0/24
App-B	10.20.1.10
VPC peering	ewb-a-to-b-peering — Active

2. Connectivity and security testing

The terminal evidence shows SSH access to App-B through the bastion host using SSH ProxyCommand. From App-B (10.20.1.10), ping tests to App-A (10.10.2.10) are shown succeeding with 4 packets received and 0% packet loss. The screenshots also show unsuccessful ping attempts followed by successful tests after a security-rule change.

The security group evidence shows SSH restricted to the bastion private IP address (10.10.1.10/32) and an ICMPv4 Echo rule. The screenshot is of the inbound-rule editor; the saved configuration can be rechecked in the AWS console if required.

3. Configuration note

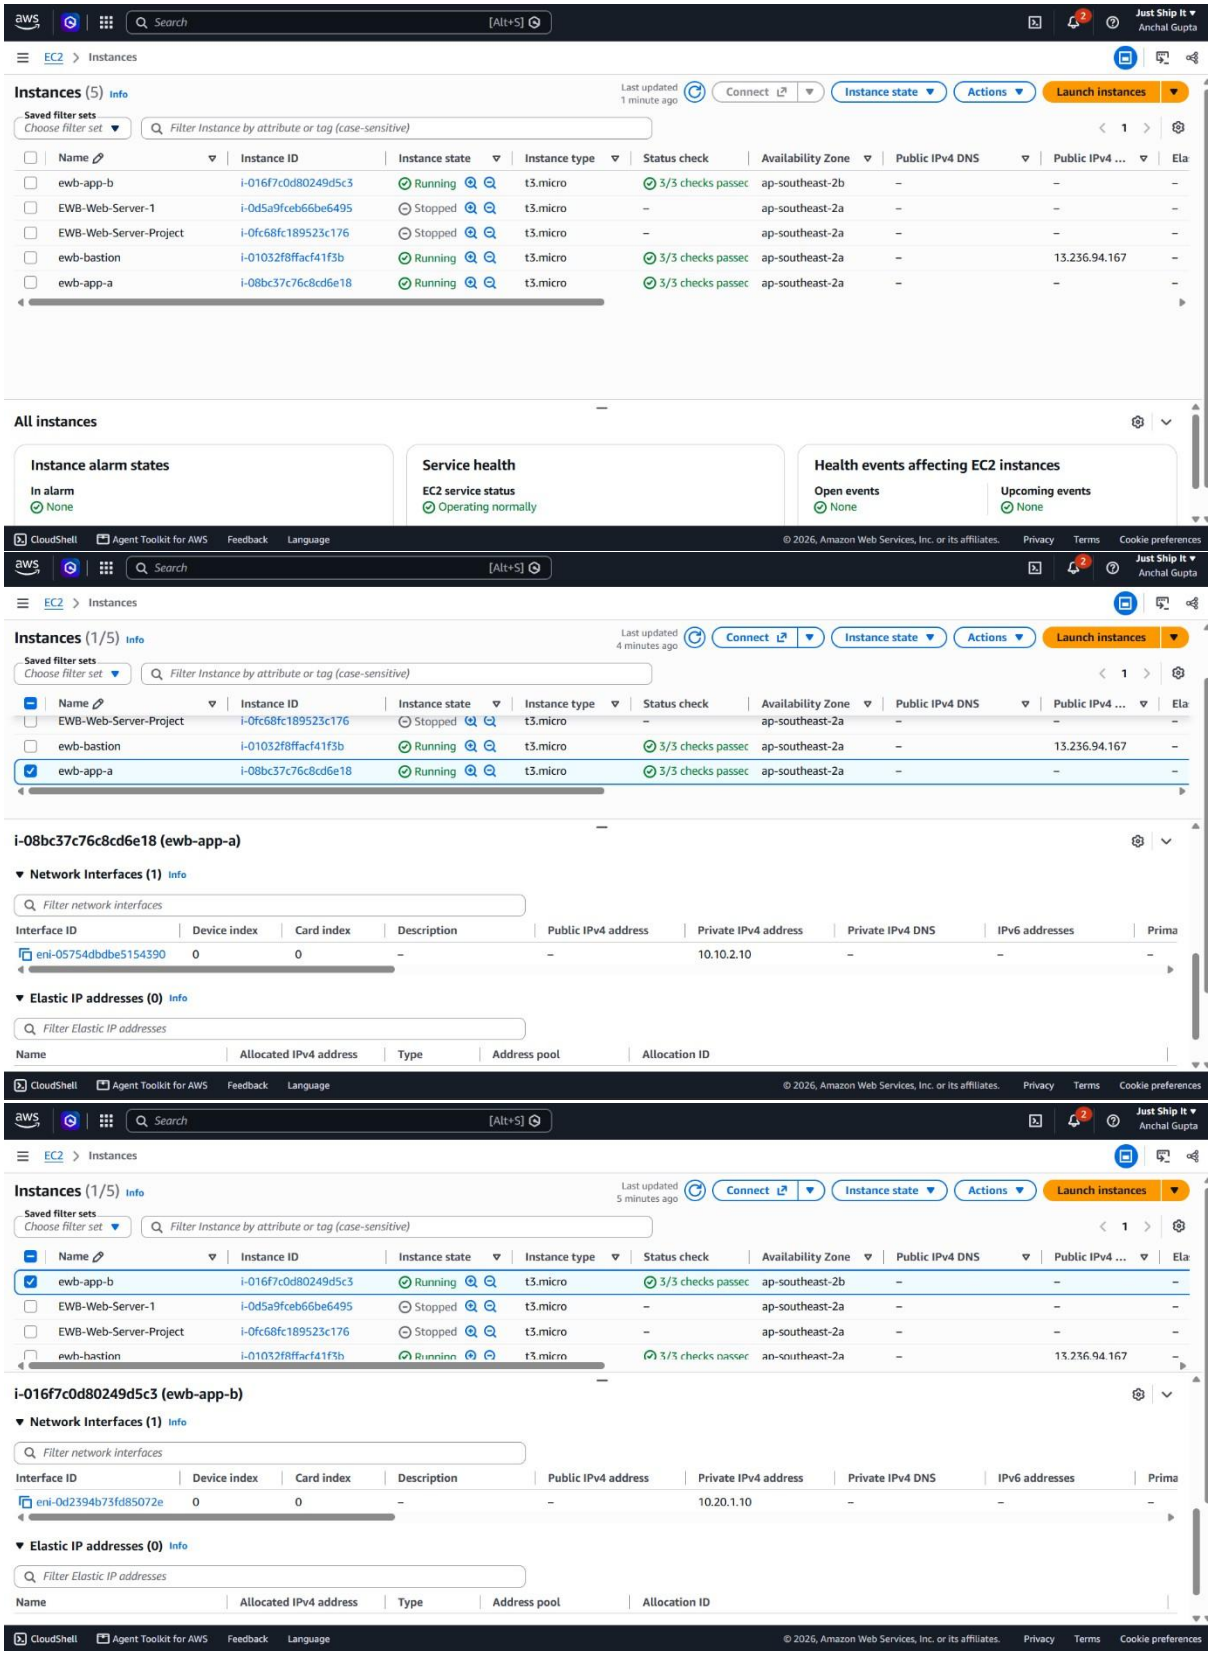

The supplied AWS console screenshots show the VPC B internet gateway in the detached state. They also show an additional subnet named ewb-b-public-1 (10.20.2.0/24) still present in VPC B. This subnet is not part of the intended private-only VPC B design. This report records what is visible in the evidence and does not claim that the extra subnet was deleted.

4. Conclusion

The captured tests demonstrate private communication between application instances in the two VPCs through the active peering connection. SSH access to the private App-B instance was established through the bastion host, and successful ICMP tests were recorded. The following are the eight original evidence pages supplied for review.

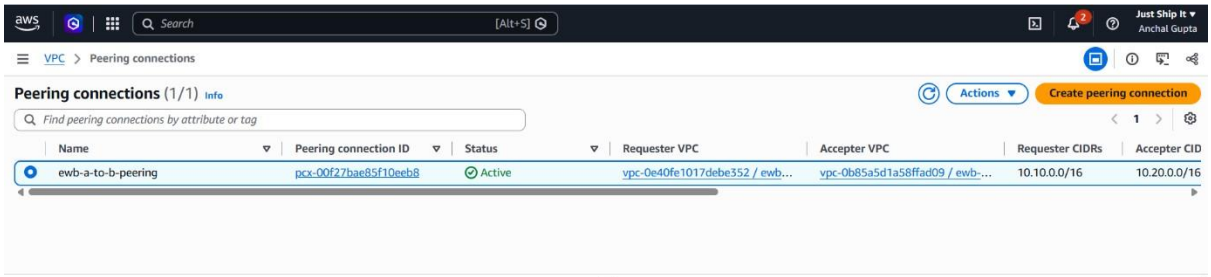

Original project evidence

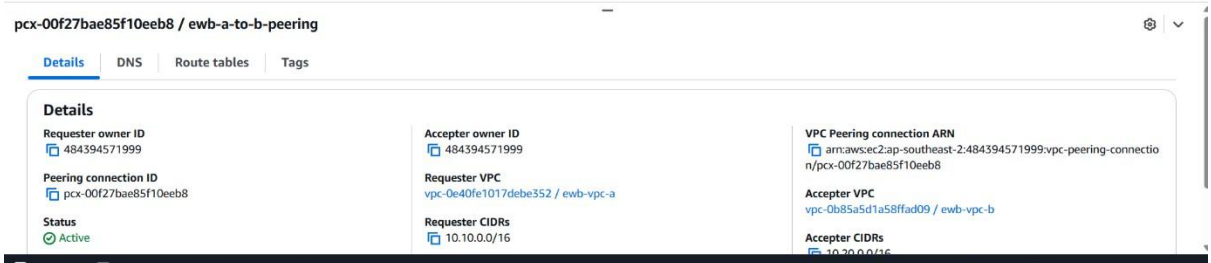

The following eight pages reproduce the original screenshots without alteration.
